Brief about the Problem Statement that the Team/Company is solving *

Now-a-days every mechanical thing has its technological alternative. For example : we used to use mercury thermometers which are mostly replaced by digital thermometers, we used to use mechanical weighting scale and now we use digital weighing machine. But we use mechanical ways to measure our height and we dont have any digital alternative. In classrooms student make their own height measuring chart which most of the time are highly inaccurate. People use measuring tape to measure their height which requires two people to properly measure which is very inconvenient. Wall mounted stature can be used for measuring height of masses like in check up medical camps, hospitals, etc. But it can easily rust and malfunction after some uses. All the methods mentioned above require more time to measure height than AHMD and all of these methods require more than 1 person to measure someone's height which is not always possible.

Describe the solution you are providing *

The simple solution to the problems stated above is the Automatic Height Measuring Device [AHMD]. The height measuring device helps the users to measure their body height with very high accuracy. It can be mounted directly to the wall with just 2 screws. The adaptive technology used in it allows the users to mount the device on the wall without even measuring its distance from the ground. This device is powered by a 12v 1a/12v 2a adapter which can be plugged into normal households' outlets. This device can measure one's height and display it in just few seconds. AHMD features a 16x2(6.6cm × 1.6cm) LCD display which shows the height in centimeters, feet and inches. The AHMD features 1 green led and 1 red led to indicate when to stand under the device to measure the height or when to wait for the other person to move, respectively. It uses hc-sr04 ultrasonic sensor to measure the height. This device also has a dht-11 humidity and temperature sensor to calibrate the hc-sr04 according to the environment's humidity and temperature. This can be used 100s of time with the same accuracy each and every time.

How is your solution unique? *

This device is the only one of its own kind. It provides a big LCD display and displays height in 3 different units. The most important feature is that it has DHT-11 humidity and temperature sensor which calibrates the device according to the humidity and temperature of the surrounding atmosphere. Without this sensor the height measured by it will vary from every season as the ultrasonic waves used by HC-SR04 are influenced by the density of the medium by which they are travelling. Humidity and temperature are the major factors to change the density of the atmosphere. The unique code allows the user to mount the device without measuring the distance between it and the ground. All these features are available in this model only which every other digital height measuring devices lack.

Briefly describe your competitive advantages over others in the market *

This device is very cheaper than other devices available in the market. This device provides more features in cheaper price. The price can be lower once mass production starts and components can directly be ordered from the manufacturers. This is the first automatic height measuring device to be invented and made in India. As it is made in India, no import taxes or charges can be imposed which will always make it cheaper from the competitors.

Describe your Team Potential *

My team consists of only me. I can solve any technical problem with ease. This project was made solely by me, this reflects my potential.

Any specific expectation from this Pre-Incubation program

I expect that I will be able to make a better prototype. I also hope that this pre-incubation program will help me make the final product and distribute this amongst various institutions.
